Definition of Done

For any user story to be marked as "Done" in our sprints, it must meet the following criteria.

A user story is considered done when:

Implementation and Testing:
- The code actually implements what the story asks for (no half finished features).
- It runs on my own machine and it works without bugs or crashing.

Team Approval:
- The code is pushed to the repo (using the Name_Action commit format) and someone else on the team has reviewed it.
- Backend check: If it touches the database, Stephan has confirmed the data saves and loads properly.
- Frontend check: If it changes the screen/UI, Emerson has confirmed it looks the way it's supposed to.

Safe to Merge:
- Merging this code into the main branch won't stop the app from running or cause errors for everyone else.
- The code is readable and comments are added where necessary.
- The user story status is updated to "Done" in the project tracker.
